

# Veritas: Secure Online Information Sharing

Veritas is a web-based incident management/information sharing system. Our system has been designed to provide our clients with easy online access to key project related information. We can tailor the modules to fit your individual needs and ensure you receive critical project updates in real time. Modules include:

**Incident Management** - Reports relating to your project will be contained in the incident reporting module. You will be able to access key information quickly. This will ensure you always have the key data required to make decisions.

**Information** - You are alerted when new information and documents are uploaded.

**Key Contacts** - All key IMAC contact information as well as any other related contacts will be maintained so you have instant access to the individuals assigned to support your project.

**Field Documentation** - Documents useful for the field staff.

**User Preferences** - Allows you to set any preferred configuration which will allow you to customize Veritas to your preference.

**Document Management** - Central location for all job related documentation and video.

**Administration** - Allows you to configure and customize Veritas based on your requirements.

Contact an IMAC representative for an online demo.
